Seeding a New Fescue Lawn

Seedbed Preparation: Till the soil approximately 6 inches deep. Level with garden or landscaping rake. Surface may be firmed by rolling or soaking, then re-raking till level. Leave top ½ inch loose to allow seed to be worked into soil.

Fertilization: Prior to or right after seeding, apply a starter fertilizer to help proper root development. Continue using a systematic fertilizer program to maintain a healthy lawn.

Seeding: Sow seeds evenly at 7-10 lbs/1,000 square feet. Rake lightly into soil. No more than 1/8 inch of soil should cover seed. Roll with a water roller.

Covering: Use blankets, pelletized or paper mulch, or straw to hold soil moisture and hasten germination. Baled straw may bring in unwanted weeds; use with caution.

Watering: Do not allow soil to dry out. Keep soil moist with frequent light watering until seedlings are visible. After lawn is established, water as necessary.

Mowing: Maintain mower height between 2 to 3 inches, never remove more than 1/3 of the grass plant with each mowing.

Weed Control: It is very common to see new weeds when planting a new lawn or disturbing the soil. For new lawns, wait 6-8 weeks before using any herbicide. For existing lawns, the best weed control is to maintain a healthy lawn by regular fertilization, proper mowing, and watering as necessary.

Overseeding An Existing Lawn

Lawn Preparation: Mow lawn to 1 inch and remove clippings. Dethatch with a power rake or hand rake smaller areas.

Seeding: Sow seed evenly at at 4-6 lbs/1,000 square feet. Work seed into existing turf by raking.

Watering: Keep soil moist with frequent, light watering until grass is established.

Mowing: Follow normal mowing practices when grass reaches 3 to 4 inches in height.
